CONTEXT BASED VIEW DESIGN TO SUPPORT CLIENT SIDE MULTI-THREADING

5

ABSTRACT

10

A computer software system comprising a view sub-system including presentation objects which provide a user interface, a business logic sub-system including business object implementation objects which hold business data and implement business logic, a handler sub-system including controller objects which control the sequence of actions in a use case, and a view context sub-system including context objects which capture input/output data. The invention also provides a related computer program and a related method of passing data in an object oriented application.
